

“Quality is the only way to maintain past, present and get new customers.”

Tips for Thermal Energy Conservation

General

- Undertake regular energy audits.
- Plug all oil leakage. Leakage of one drop of oil per second amounts to a loss of over 2000 liters/year.
- Filter oil in stages. Impurities in oil affect combustion.
- Pre-heat the oil. For proper combustion, oil should be at right viscosity at the burner tip. Provide adequate Pre-heat capacity.
- Incomplete combustion leads to wastage of fuel. Observe the colour of smoke emitted from chimney. Black smoke indicates improper combustion and fuel wastage. White smoke indicates excess air & hence loss of heat. Hazy brown smoke indicates proper combustion.
- Use of Low air pressure “film burners” helps save oil upto 15% in furnaces.
